1.Introduction:

1.1 Overview:

In this import export project, I have worked basically worked on the data set of imports done in India by various countries in the world. This project is a tableau dashboard and story telling related to import export data sheet. Project contains various products exported by various countries in the world to India.

1.2 Purpose:

This project basically focuses on the types of the product exported, their value and also the quantity in which products are exported. Purpose of this is to track what india imports the most, what's the quantity and its value. By tracking these things one will understand the demand of the product and various other production related decisions i.e, to import it or not or to produce some high value product in india, such decisions can be taken easily by using tableau dashboard.

2.Analysis:

By analysing the data by using a tableau dashboard we came to know that India Imports mostly Petroleum,crude oil and its products by Saudi Arab. Also Indonesia is the biggest exporter of coal and coke. Also india imports various products from china at higher quantity and higher value. As these products are costing us highly and helps china for building their economy, this is not good signs for india as we know their is no much good relation with them. Also by analysing data we found that india is biggest importer of various electronic products and plastic too. Various products which can be produced in india itself are been imported. By using the dashboard and selecting countries one by one , we can get the total data of every thing about exports done to India.

Conclusion:

1. Imports are in high value by India
2. Imports are increasing year by year
3. If India produces products and if Indian Government gives some incentives then these import charges and other liabilities can be eliminated.
